What to Expect in This Module

The role of views

Describing UI views with XAML

Accessing XAML views in code behind

Handling XAML events in code behind

Summary

- Views provide the details of a Xamarin.Forms UI
- Xamarin.Forms UIs can be described with XAML
 - Consists of a Xamarin.Forms and Microsoft namespaces
 - Microsoft XAML namespace traditionally prefixed as “x”
- A code behind file provides the execution code for a XAML UI
- Use the x:Name attribute to expose UI elements to code behind
- View events can be handled by code behind
 - Reference event handler method name in the appropriate XAML attribute
